

CEH v13 Practice Questions – Module 12: Evading IDS, Firewalls, and Honeypots

1. What is the purpose of an Intrusion Detection System (IDS)?

- A. To encrypt data at rest
- B. To detect and alert on unauthorized network activity
- C. To prevent system boot failures
- D. To manage firewall rules automatically

Answer: B

2. Which of the following best describes a signature-based IDS?

- A. It uses AI to block unknown threats
- B. It detects attacks based on known patterns
- C. It learns user behavior over time
- D. It uses port mirroring to block traffic

Answer: B

3. What is a common method used to evade signature-based IDS?

- A. Obfuscating payloads
- B. Using a VPN
- C. Updating antivirus software
- D. Rebooting the IDS

Answer: A

4. What is the primary role of a firewall?

- A. Encrypt network traffic
- B. Analyze malware in sandboxes
- C. Control incoming and outgoing network traffic
- D. Store credentials securely

Answer: C

5. Which technique involves breaking an attack payload into smaller pieces to avoid detection?

- A. Port scanning
- B. Packet fragmentation
- C. Banner grabbing
- D. Credential stuffing

Answer: B

6. What is a honeypot used for?

- A. Accelerate data transfer
- B. Lure and analyze attacker behavior
- C. Serve as a backup DNS server
- D. Prevent brute-force attacks on firewalls

Answer: B

7. How does protocol tunneling help evade firewalls?

- A. Encrypts data at rest
- B. Disguises traffic as legitimate protocols
- C. Blocks all outbound traffic
- D. Replaces packet headers with random values

Answer: B

8. What is the purpose of polymorphic shellcode?

- A. It slows down antivirus scans
- B. It changes its code while maintaining functionality to avoid detection
- C. It encrypts all communication with the C2 server
- D. It stores payloads in registry keys

Answer: B

9. Which firewall evasion technique manipulates IP packet flags?

- A. TCP ACK scan

- B. XMAS scan
- C. SYN-ACK flooding
- D. TTL manipulation

Answer: B

10. How can attackers use encrypted traffic to evade IDS detection?

- A. By scanning unencrypted payloads
- B. By avoiding ports above 1024
- C. By using SSL/TLS to hide malicious payloads
- D. By limiting packets to 64 bytes

Answer: C

11. Which tool is often used to test firewall and IDS evasion techniques?

- A. Metasploit
- B. Burp Suite
- C. Netcat
- D. Shodan

Answer: A

12. What does the term 'false positive' mean in IDS context?

- A. Attack missed by the IDS
- B. Legitimate activity flagged as malicious
- C. Duplicate log entries
- D. Traffic blocked without inspection

Answer: B

13. What is the main risk of tuning an IDS too strictly?

- A. It will ignore encrypted traffic
- B. It can crash the network switch
- C. It may allow attacks to go undetected
- D. It increases false positives

Answer: D

14. How can attackers avoid triggering honeypots?

- A. By only attacking during business hours
- B. By scanning for default honeypot banners
- C. By using non-standard port ranges
- D. By encrypting all packets

Answer: B

15. Which of the following is a behavior-based IDS system?

- A. Snort
- B. Suricata
- C. OSSEC
- D. Bro/Zeek

Answer: D

16. Which IDS evasion technique delays the sending of packets?

- A. Packet splitting
- B. Fragmentation
- C. Time-based evasion
- D. Reverse DNS spoofing

Answer: C

17. What is the purpose of reverse shell encoding?

- A. Encrypt network traffic
- B. Obfuscate the payload to bypass IDS
- C. Increase shell reliability
- D. Block traffic to remote hosts

Answer: B

18. Why is outbound firewall rule monitoring important?

- A. It blocks incoming port scans
- B. It prevents users from uploading files
- C. It can detect data exfiltration attempts
- D. It disables packet sniffing

Answer: C

19. Which type of firewall operates at the application layer?

- A. Packet-filtering firewall
- B. Circuit-level gateway
- C. Stateful inspection firewall
- D. Proxy firewall

Answer: D

20. Which of the following can help detect honeypots?

- A. High response latency
- B. Closed outbound connections
- C. Excessive logging behavior
- D. All of the above

Answer: D

21. What is the function of a stateful firewall?

- A. It encrypts all session data
- B. It blocks ICMP packets
- C. It keeps track of active connections
- D. It logs all DNS requests

Answer: C

22. Which IDS evasion technique uses encoding variations to hide attacks?

- A. Base64 encoding
- B. URL encoding
- C. Unicode encoding
- D. All of the above

Answer: D

23. What can an attacker learn by fingerprinting an IDS?

- A. The public IP address
- B. Specific signatures used

- C. DNS record history
- D. Firewall version number

Answer: B

24. Which protocol is often abused for evading firewalls via tunneling?

- A. HTTP
- B. ICMP
- C. FTP
- D. POP3

Answer: B
